Requirements

different set of information for each UI

no excessive data transfer usage

new features provided easily and quickly

change in one UI shouldn't force change in another one

#1 One suit-them-all endpoint?

-

excessive data transfer usage
too much information revealed
entanglement between clients
no fast changes

+

one place to change and maintain

A blue square icon with rounded corners.

/offers

#2 Separate endpoints

-

too much information revealed
excessive data usage
many calls to build a model

+

more elasticity in designing UI
clean API

/offers

/offers/{}/locations

/employers

#3 Backends for frontends

-

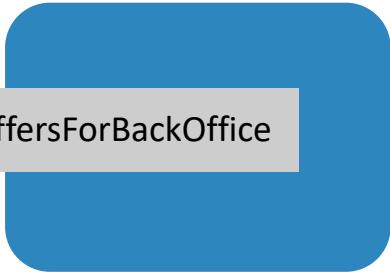

messy API
maintenance problems
many places to change
UI driven backends

+

tailored data model
client oriented
control over what client gets

When to use GraphQL?

readonly data

many UIs, single API

frontend not driven by backend

not knowing clients' exact needs – (e.g. public APIs)

frequent UI changes (agile environment)

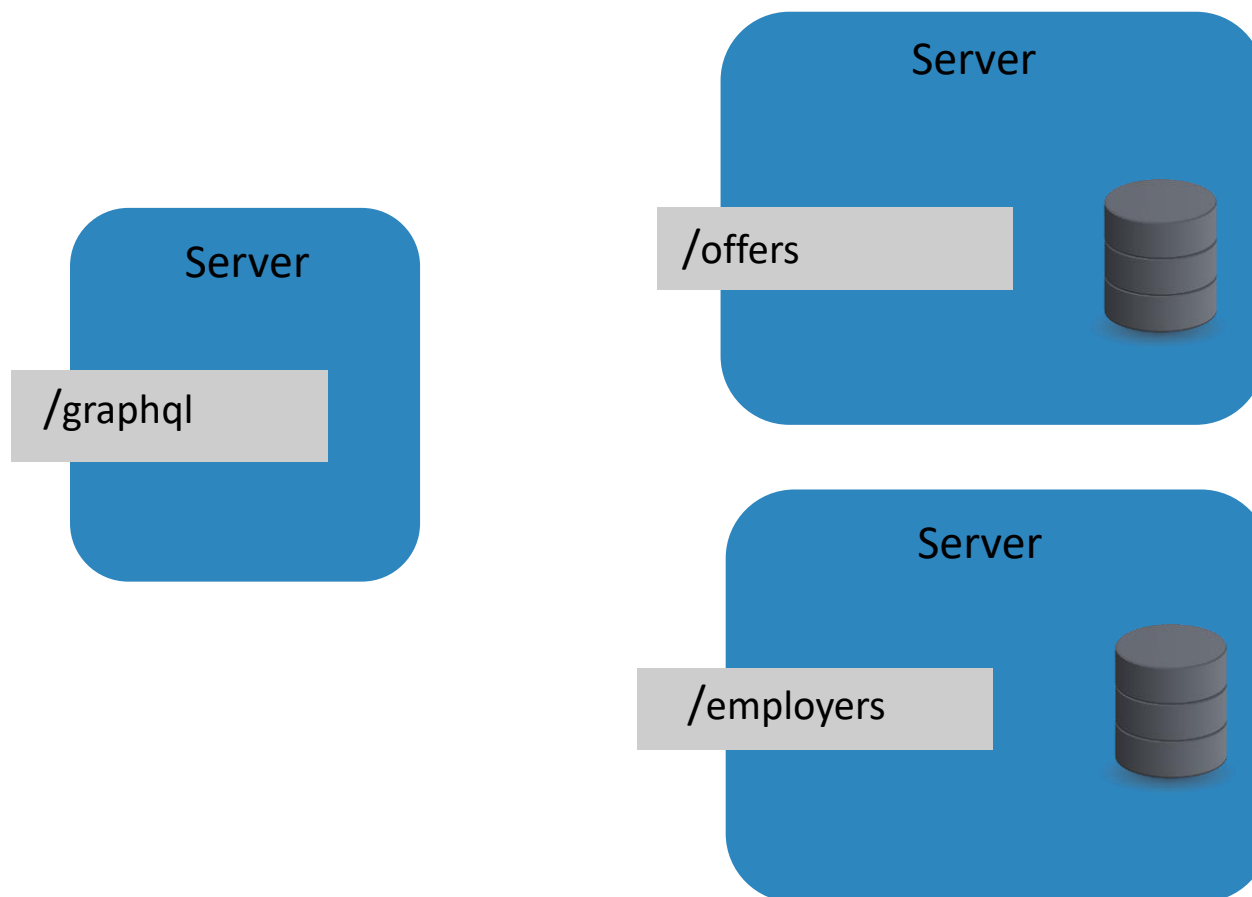

Architecture possibilities #1

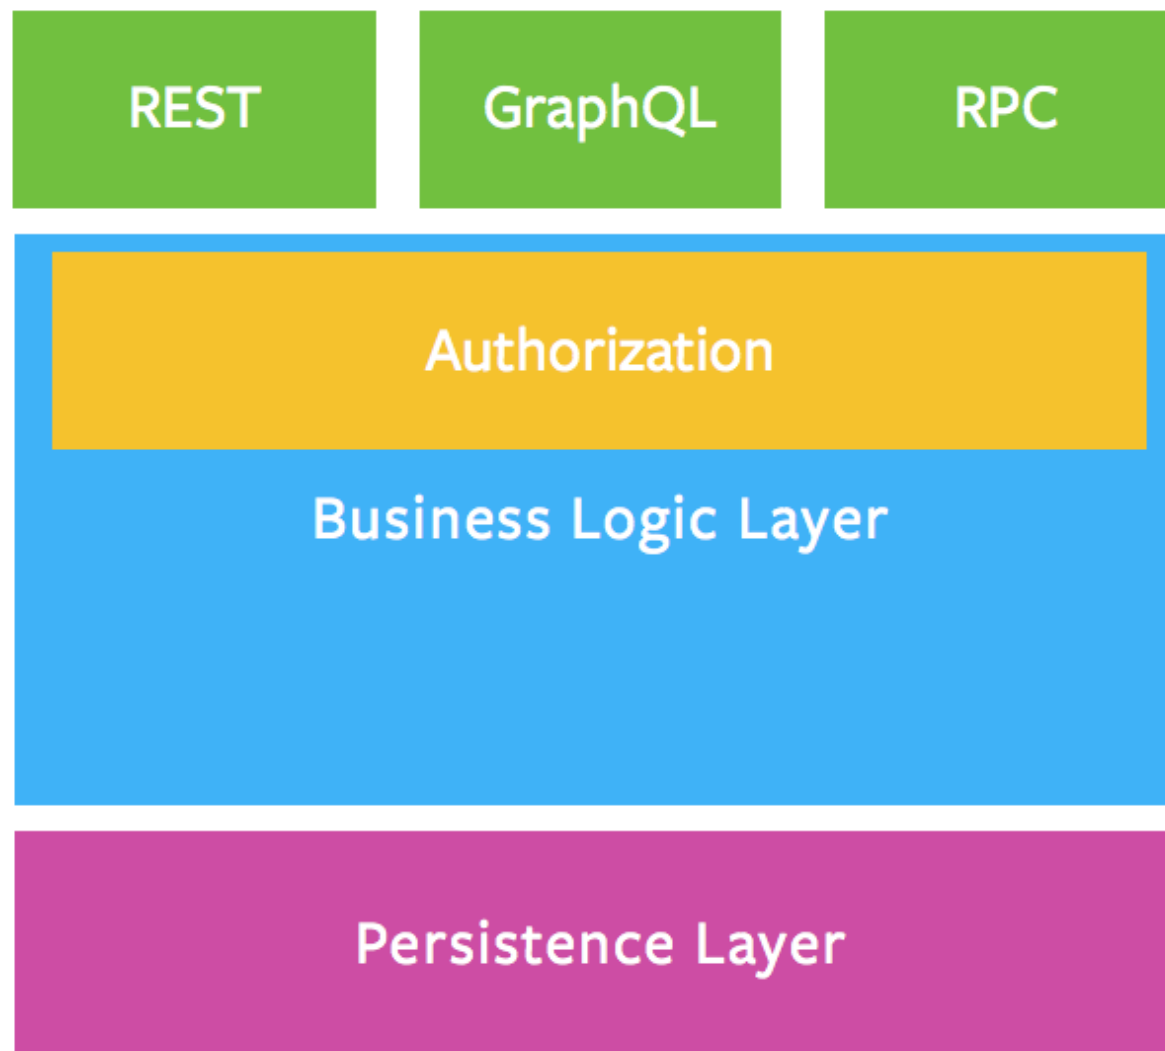

Architecture possibilities #2

Architecture possibilities #3

<http://graphql.github.io/learn/thinking-in-graphs/#business-logic-layer>

Who's using GraphQL?

Facebook's mobile apps have been powered by GraphQL since 2012.
A GraphQL spec was open sourced in 2015 and is now available in
many environments and used by teams of all sizes.

intuit.

<https://graphql.org/>

Before rewriting every API to GraphQL...

understand the tradeoffs

What about REST?

service to service communication
operations modifying resources
validation of provided data
optimization around resources not clients
caching
monitoring
constraints on client's behaviour

Conclusion

presented with legitimate proof based on
mathematics,
literature
and common sense

If...

Speech is silver and silence is golden

- *proverb*

Where

Speech is silver and **silence** is golden

The **speech** was about GraphQL

And

Speech is silver and **silence** is golden

speech = GraphQL

The rest is **silence**

– *W. Shakespeare*

Then

Speech is silver and **silence** is golden

speech = GraphQL

silence = rest

GraphQL is silver and **REST** is golden.

GraphQL, REST, gRPC, carrier pigeons...

Use whatever suits your needs!
